

#3 – support custom token "BracketedSpan"

Reported by @UnquietCode

Milestone: Version 2

Support a new span token "BracketedSpan". Which looks like: `[text]{metadata}`

- ☒ implement a new token class
- ☐ pass token to our renderer on init
- ☐ define a new render method `render_bracketedspan` (or maybe `render_bracketed_span`) which will be invoked by mistletoe
- ☐ for now render it in latex by just rendering the text part, ignoring the metadata
- ☐ test that it renders
