

## **#9 – combine the custom renderer and pandoc into a docker container**

**Reported by @UnquietCode**

**Milestone: Version 1**

Use the pandoc docker container and add in this codebase to produce a docker image which can render a single PDF from a single markdown file.

ROCKY EDIT:

- ☐ image 1 wraps xelatex binary as entrypoint
- ☐ image 2 martek image that inherits from 1, takes in contents as file or standard input and runs martek on it
- ☐ image 3 = take in github info, and run the script in image 2
